## Callous plane

### Abstract

10 A callous plane 1 having a blade head 2 and a handle 3 is dis-  
closed, where callous plane 1 has an underside facing the body  
surface of a user when in working position, and an upper side  
facing away from said underside, and where a holding device 4  
with a lower holding part 7 and an upper holding part 9 is pro-  
15 vided in the blade head 2, in which a blade 5 can be held in  
such a manner that its cutting edge 6 intended for use to shave  
off callous skin is located on the underside of callous plane  
1. To provide a callous plane 1 that is safer and easier to  
handle, and less complex to manufacture, it is proposed that  
20 lower holding part 7 be connected to handle 3 and display an  
upward-pointing seat 8 for blade 5, and that upper holding part  
9 hold blade 5 tightly in seat 8 with the help of a fixing de-  
vice. (Fig. 1)
